

Clinic Management System

RFID and barcode based patient and pet tracking, appointments, records, billing, and inventory — one system, tailored for both human clinics and veterinary/pet clinics.

Patient & pet identity

- RFID or barcode ID issued per patient (human clinics) or per pet (veterinary/pet clinics)
- Instant check-in by tap or scan — no manual lookup at the front desk
- Full visit history attached to that single identity, every visit, every time

Appointments & records

- Online and front-desk appointment scheduling with reminders
- Digital medical/veterinary records — visit notes, treatments, prescriptions, vaccinations
- Owner/guardian profiles linked to one or more patients or pets

Billing & inventory, connected

- Billing generated directly from services rendered and supplies used during a visit
- Barcode-tracked medical/veterinary inventory — supplies, medication, consumables
- Automatic stock deduction at point of use, with low-stock alerts

Built for both sides of the practice

Human clinics	Patient check-in, appointment scheduling, visit records, billing, and inventory for a general or specialty medical practice.
Pet / veterinary clinics	Pet profiles per owner, vaccination and treatment history, boarding/grooming scheduling, and the same billing and inventory foundation, tuned for veterinary workflows.

Why this matters

Clinics juggle patients (or pets), appointments, records, billing, and inventory as four separate problems more often than not. Tying all four to one RFID/barcode identity — the same foundation used across our other products — means front-desk staff scan once, and everything downstream (the visit record, the bill, the inventory count) updates itself.
